1.Perform Linear Search on an array.

```
def linearSearch(array, n, x):

    # Going through array sequencially
    for i in range(0, n):
        if (array[i] == x):
            return i
    return -1

array = [2, 4, 0, 1, 9]
x = int(input())
n = len(array)
result = linearSearch(array, n, x)
if(result == -1):               list: arr
    print("Element not found")
else:                           (6 items) [1, 5, 6, 9, 10, ...]
    print("Element found at index: ", result)
```

```
4
Element found at index:  1
```

2.Perform Binary Search on a list stored in an array.

```
def binarySearch(array, x, low, high):
    while low <= high:

        mid = low + (high - low)//2

        if array[mid] == x:
            return mid

        elif array[mid] < x:
            low = mid + 1

        else:
            high = mid - 1

    return -1
array = [3, 4, 5, 6, 7, 8, 9]
x = 4

result = binarySearch(array, x, 0, len(array)-1)

if result != -1:
    print("Element is present at index " + str(result))
else:
    print("Not found")
```

```
Element is present at index 1
```

3.Develop a program to implement bubble sort technique.

```
def bubbleSort(array):
  for i in range(len(array)):

    # loop to compare array elements
    for j in range(0, len(array) - i - 1):
      if array[j] > array[j + 1]:
        temp = array[j]
        array[j] = array[j+1]
        array[j+1] = temp

data = [-2, 45, 0, 11, -9]

bubbleSort(data)

print('Sorted Array in Ascending Order:')
print(data)
```

```
Sorted Array in Ascending Order:
[-9, -2, 0, 11, 45]
```

4.Develop a program to implement selection sort technique.

```
def selectionSort(array, size):
   for step in range(size):
        min_idx = step
        for i in range(step + 1, size):
            if array[i] < array[min_idx]:
                min_idx = i
        (array[step], array[min_idx]) = (array[min_idx], array[step])
data = [-2, 45, 0, 11, -9]
size = len(data)
selectionSort(data, size)
print(data)
```

```
[-9, -2, 0, 11, 45]
```

5.Develop a program to implement insertion sort technique.

```
def insertionSort(array):
  for step in range(1, len(array)):
    key = array[step]
    j = step - 1
    while j >= 0 & key < array[j]:
      array[j + 1] = array[j]
      j = j - 1
    array[j + 1] = key
data = [9, 5, 1, 4, 3]
insertionSort(data)
print("InsertionSort", data)
```

```
InsertionSort [3, 4, 1, 5, 9]
```

6.Develop a program to implement quick sort technique.

```
def partition(array, low, high):
  pivot = array[high]

  # pointer for greater element
  i = low - 1
  for j in range(low, high):
    if array[j] <= pivot:
      i = i + 1

      # swapping element at i with element at j
      (array[i], array[j]) = (array[j], array[i])

  # swap the pivot element with the greater element specified by i
  (array[i + 1], array[high]) = (array[high], array[i + 1])

  # return the position from where partition is done
  return i + 1

# function to perform quicksort
def quickSort(array, low, high):
  if low < high:
    pi = partition(array, low, high)

    # recursive call on the left of pivot
    quickSort(array, low, pi - 1)

    # recursive call on the right of pivot
    quickSort(array, pi + 1, high)

data = [8, 7, 2, 1, 0, 9, 6]
print("Unsorted Array")
print(data)

size = len(data)

quickSort(data, 0, size - 1)

```

```
print('Sorted Array in Ascending Order:')
```

```
Unsorted Array
[8, 7, 2, 1, 0, 9, 6]
Sorted Array in Ascending Order:
[0, 1, 2, 6, 7, 8, 9]
```

7.Develop a program to implement merge sort technique.

```
def merge_sort(unsorted_array):
    if len(unsorted_array) > 1:
        mid = len(unsorted_array) // 2  # Finding the mid of the array
        left = unsorted_array[:mid]  # Dividing the array elements
        right = unsorted_array[mid:]  # into 2 halves

        merge_sort(left)
        merge_sort(right)
                                list: arr
        i = j = k = 0
                                (6 items) [1, 5, 6, 9, 10, ...]
        #  data to temp arrays L[] and R[]
        while i < len(left) and j < len(right):
            if left[i] < right[j]:
                unsorted_array[k] = left[i]
                i += 1
            else:
                unsorted_array[k] = right[j]
                j += 1
            k += 1

        # Checking if any element was left
        while i < len(left):
            unsorted_array[k] = left[i]
            i += 1
            k += 1

        while j < len(right):
            unsorted_array[k] = right[j]
            j += 1
            k += 1

def print_list(array1):
    for i in range(len(array1)):
        print(array1[i], end=" ")
    print()

if __name__ == '__main__':
    array = [20, 30, 60, 40, 10, 50]
    print("Given array is", end="\n")
    print_list(array)
    merge_sort(array)
    print("Sorted array is: ", end="\n")
    print_list(array)
```

```
Given array is
20 30 60 40 10 50
Sorted array is:
10 20 30 40 50 60
```

8. Design a program to create a singly linked list for the following operations

#• Insert a Node at Beginning, at Ending and at a given Position

#• Delete a Node at Beginning, at Ending and at a given Position

#• Search, Count the Number of Nodes and Display

```
class Node:
    def __init__(self, data):

40         elif i is '%':
41             return int(op2)%int(op1)
42 s=evaluate_postfix()
43 expr=input('enter the postfix expression')
44 value=s.evalute(expr)
45 print('the result of postfix expression',expr,'is',value)
```

```
    enter the postfix expression56/45*23++
    the result of postfix expression 56/45*23++ is 25
```

15.Create a queue and perform various operations on it.

```python
# Queue implementation in Python
class Queue:

    def __init__(self):
        self.queue = []

    # Add an element
    def enqueue(self, item):
        self.queue.append(item)

    # Remove an element
    def dequeue(self):
        if len(self.queue) < 1:
            return None
        return self.queue.pop(0)

    # Display  the queue
    def display(self):
        print(self.queue)

    def size(self):
        return len(self.queue)
q = Queue()
q.enqueue(1)
q.enqueue(2)
q.enqueue(3)
q.enqueue(4)
q.enqueue(5)

q.display()

q.dequeue()

print("After removing an element")
q.display()
```

```
list: arr
(6 items) [1, 5, 6, 9, 10, ...]
```

```
[1, 2, 3, 4, 5]
After removing an element
[2, 3, 4, 5]
```

16.Construct a binary tree and perform various traversals.

```python
class Node:
    def __init__(self, item):
        self.left = None
        self.right = None
        self.val = item
def inorder(root):

    if root:
        # Traverse left
        inorder(root.left)
        # Traverse root
        print(str(root.val) + "->", end='')
        # Traverse right
        inorder(root.right)
def postorder(root):

    if root:
        # Traverse left
        postorder(root.left)
        # Traverse right
        postorder(root.right)
        # Traverse root
        print(str(root.val) + "->", end='')
def preorder(root):

    if root:
        print(str(root.val) + "->", end='')
        preorder(root.left)
        preorder(root.right)
root = Node(1)
root.left = Node(2)
root.right = Node(3)
root.left.left = Node(4)
root.left.right = Node(5)
print("Inorder traversal ")
```

```
inorder(root)
print("\nPreorder traversal ")
preorder(root)
print("\nPostorder traversal ")
postorder(root)
```

```
Inorder traversal
4->2->5->1->3->
Preorder traversal
1->2->4->5->3->
Postorder traversal
4->5->2->3->1->
```

17.Construct a binary search tree and perform a search operation.

```
class GFG :
    def main( args) :
        tree = BST()
        tree.insert(30)
        tree.insert(50)
        tree.insert(15)
        tree.insert(20)
        tree.insert(10)
        tree.insert(40)
        tree.insert(60)
        tree.inorder()
class Node :
    left = None
    val = 0
    right = None
    def __init__(self, val) :
        self.val = val
class BST :
    root = None
    def insert(self, key) :
        node = Node(key)
        if (self.root == None) :
            self.root = node
            return
        prev = None
        temp = self.root
        while (temp != None) :
            if (temp.val > key) :
                prev = temp
                temp = temp.left
            elif(temp.val < key) :
                prev = temp
                temp = temp.right
        if (prev.val > key) :
            prev.left = node
        else :
            prev.right = node
    def inorder(self) :
        temp = self.root
        stack = []
        while (temp != None or not (len(stack) == 0)) :
            if (temp != None) :
                stack.append(temp)
                temp = temp.left
            else :
                temp = stack.pop()
                print(str(temp.val) + " ", end ="")
                temp = temp.right

if __name__=="__main__":
    GFG.main([])
```

list: arr

(6 items) [1, 5, 6, 9, 10, ...]

```
10 15 20 30 40 50 60
```

18.Implement Depth First Search, Breadth First Search traversals on a graph.

```
# Using a Python dictionary to act as an adjacency list
graph = {
   '5' : ['3','7'],
   '3' : ['2', '4'],
   '7' : ['8'],
   '2' : [],
```

```
    '4' : ['8'],
    '8' : []
  }

  visited = set() # Set to keep track of visited nodes of graph.

  def dfs(visited, graph, node):  #function for dfs
      if node not in visited:
          print (node)
          visited.add(node)
          for neighbour in graph[node]:
              dfs(visited, graph, neighbour)

  # Driver Code
  print("Following is the Depth-First Search")
  dfs(visited, graph, '5')

  graph = {                          list: arr
    '5' : ['3','7'],
    '3' : ['2', '4'],                (6 items) [1, 5, 6, 9, 10, ...]
    '7' : ['8'],
    '2' : [],
    '4' : ['8'],
    '8' : []
  }

  visited = [] # List for visited nodes.
  queue = []     #Initialize a queue

  def bfs(visited, graph, node): #function for BFS
    visited.append(node)
    queue.append(node)

    while queue:          # Creating loop to visit each node
      m = queue.pop(0)
      print (m, end = " ")

      for neighbour in graph[m]:
        if neighbour not in visited:
          visited.append(neighbour)
          queue.append(neighbour)

  # Driver Code
  print("Following is the Breadth-First Search")
  bfs(visited, graph, '5')
```

```
Following is the Depth-First Search
5
3
2
4
8
7
Following is the Breadth-First Search
5 3 7 2 4 8
```

19.Implement Dijkstra's Shortest Path Algorithm

```
import heapq
def calculate_distances(graph, starting_vertex):
    distances = {vertex: float('infinity') for vertex in graph}
    distances[starting_vertex] = 0

    pq = [(0, starting_vertex)]
    while len(pq) > 0:
        current_distance, current_vertex = heapq.heappop(pq)
        if current_distance > distances[current_vertex]:
            continue

        for neighbor, weight in graph[current_vertex].items():
            distance = current_distance + weight
            if distance < distances[neighbor]:
                distances[neighbor] = distance
                heapq.heappush(pq, (distance, neighbor))

    return distances
example_graph = {
    'U': {'V': 2, 'W': 5, 'X': 1},
```

```
    'V': {'U': 2, 'X': 2, 'W': 3},
    'W': {'V': 3, 'U': 5, 'X': 3, 'Y': 1, 'Z': 5},
    'X': {'U': 1, 'V': 2, 'W': 3, 'Y': 1},
    'Y': {'X': 1, 'W': 1, 'Z': 1},
    'Z': {'W': 5, 'Y': 1},
}
print(calculate_distances(example_graph, 'X'))
```

```
{'U': 1, 'V': 2, 'W': 2, 'X': 0, 'Y': 1, 'Z': 2}
```

20.Develop a program to implement heap sort technique.

```
def heapify(arr, n, i):
      # Find largest among root and children
      largest = i
      l = 2 * i + 1
      r = 2 * i + 2
                              list: arr
      if l < n and arr[i] < arr[l]:   (6 items) [1, 5, 6, 9, 10, ...]
          largest = l

      if r < n and arr[largest] < arr[r]:
          largest = r

      # If root is not largest, swap with largest and continue heapifying
      if largest != i:
          arr[i], arr[largest] = arr[largest], arr[i]
          heapify(arr, n, largest)
def heapSort(arr):
      n = len(arr)

      # Build max heap
      for i in range(n//2, -1, -1):
          heapify(arr, n, i)

      for i in range(n-1, 0, -1):
          # Swap
